

BIBLE VERSE AND PREYER MANAGEMENT SYSTEM

CASE STUDY: GAKO CHURCH

BY

NIYITANGUMUGISHA Bernard

REG NO: 2309001108

Research proposal submitted in partial fulfillment of the requirement for the award of Bachelor of Information technology (BIT) submitted to School of Computing Information Technology.

January, 2026

DECLARATION

I NIYITANGUMUGISHA Bernard, do declare that this work entitled “**BIBLE VERSE AND PREYER MANAGEMENT SYSTEM**” is my own work. I have to the best of my knowledge all authors or sources from where I got information. I further declare that this work has not been submitted in any university or institution for the award of a degree or any of its equivalents.

Student Name: NIYITANGUMUGISHA Bernard Sign

_____ Date _____

Declaration by the supervisor(s)

This research proposal has been submitted with our approval as The University of Kigali
Supervisor(s).

Names: MWUNGURA Jean de dieu

Sign _____ Date _____

For and on behalf of University of Kigali

Head of Department

Name: Mercy Nyankunde

Sign _____ Date _____

For and on behalf of University of Kigali Dean,

School/Faculty

Name: **Dr. Wilson MUSONI**

For and on behalf of University of Kigali

APPROVAL

This is to acknowledge that this dissertation has been submitted with my approval.

Supervisor name MWUNGURA Jean de dieu

Signed.....

Date

DEDICATION

This project proposal is dedicated with profound admiration and appreciation to GOD for giving me strength and breathe and my teachers for their moral support. Great appreciation also goes to my supervisor Mr. MWUNGURA Jean de dieu and all my lecturers, classmates and family who made it a success through their constant support supervision, encouragement and moral support.

ACKNOWLEDGEMENT

I deeply acknowledge to the almighty GOD and my Family for everything they did to make my research project successful.

I sincerely have deep recognition to my supervisor Mr. MWUNGURA Jean de dieu who guides me in the accomplishment of this work, especially for his substantial advice, professional assistance, guidance and precious ideas.

I acknowledge the sources from which I got this information that I used while writing this dissertation.

I thank the authorities of University of Kigali as well as the staff of department of Information Technology. Special thanks to my family, colleagues and friends for their support, encouragement, friendship and to those who participated in one way or another in the accomplishment of this work.

MAY GOD BLESS YOU ALL!

ABSTRACT

This project presents the design and implementation of a Bible Verse and Prayer Management System aimed at enhancing daily spiritual engagement among church members. The system enables registered members to securely log in and receive daily Bible verses and prayer notifications prepared and scheduled by the church administrator.

The study adopts a descriptive and developmental research design, utilizing interviews and observation to gather system requirements. The system provides administrative functionalities for managing users, Bible verses, prayers, and monitoring engagement.

The findings indicate that automated daily notifications encourage consistent Bible reading and prayer practices. The system improves communication between the church and its members while ensuring controlled access and effective content delivery. The project demonstrates how information technology can support spiritual growth through structured digital solutions.

..... 10

CHAPTER 1: INTRODUCTION

1.1 General Introduction

In today's world, people are increasingly seeking ways to deepen their spiritual life and maintain a consistent connection with their faith. Daily engagement with the Bible through reading verses and reflecting on prayers plays a critical role in nurturing personal growth, moral guidance, and inner peace. However, many church members face challenges in maintaining this daily spiritual practice due to busy schedules, forgetfulness, or lack of structured guidance (FAO, 2016)).

The Bible verse and prayer management system is designed to address these challenges by providing church members with a simple and organized platform to receive daily Bible verses. This system ensures that members can consistently engage with scripture without the need for manual scheduling or searching for passages (Maslakci, 2020)). By delivering daily verses digitally, the system promotes regular reflection, spiritual discipline, and a closer relationship with God.

This project focuses on creating a user-friendly and accessible system that allows church members to receive and read a selected verse each day. The system is intended to enhance the spiritual life of the community while providing the church, acting as the administrator, with a tool to guide and support its members in their daily devotional practices.

By leveraging digital technology, the system offers an efficient way to encourage daily Bible reading and reflection, making spiritual growth accessible to every member, regardless of their location or schedule. This approach aligns with modern trends in digital ministry and ensures that faith-based practices remain a central part of daily life in a connected world.

1.2 Background of the study

Faith and spirituality play a central role in the lives of many people around the world. For Christians, regular engagement with the Bible through reading and prayer is essential for spiritual growth, moral guidance, and maintaining a strong personal relationship with God. Daily exposure to scripture encourages reflection, strengthens faith, and provides members with practical guidance for daily life.

Despite the importance of daily Bible reading, many church members struggle to maintain consistency. Busy schedules, forgetfulness, and lack of structured guidance often prevent individuals from engaging with scripture every day. This inconsistency can limit the spiritual growth and community engagement that regular Bible reading fosters.

The increasing use of digital technologies in daily life offers an opportunity to address these challenges. Mobile phones, tablets, and other digital devices provide a convenient way to deliver content directly to users, ensuring that they have access to spiritual resources wherever they are. By leveraging this technology, church leaders can provide a consistent and organized system that delivers daily Bible verses to members, supporting their devotional practices and fostering a habit of regular reflection.

The Bible verse and prayer management system is designed to meet this need by creating a platform where church members receive a daily Bible verse automatically. This system not only helps members maintain regular spiritual practices but also enables the church, acting as the administrator, to guide and monitor the spiritual engagement of its community. Through the system, members can easily receive meaningful scripture each day, enhancing their faith and reinforcing the role of the church in supporting their spiritual journey.

By implementing this system, the church can strengthen the spiritual life of its members, promote consistent Bible reading, and encourage prayer as part of daily routine. The project reflects the growing intersection of faith and technology, ensuring that spiritual guidance remains accessible, organized, and relevant in the digital era.

1.3 Problem Statement

Regular engagement with the Bible and prayer is a vital part of a Christian's spiritual growth. However, many church members face challenges in maintaining a consistent routine of daily scripture reading. Busy schedules, forgetfulness, and the absence of structured guidance often prevent members from dedicating time each day to read Bible verses and reflect on their meaning.

Currently, most churches rely on physical gatherings, announcements during services, or printed materials to encourage daily scripture reading. These methods are often inconsistent and do not

reach members who cannot attend services regularly. As a result, members may miss opportunities to engage with daily spiritual guidance, which can limit their personal growth and connection to the church community.

Moreover, there is no centralized digital system that allows the church to systematically provide daily Bible verses to its members. This gap creates difficulties in monitoring engagement and providing timely spiritual resources. Church leaders are unable to ensure that all members have equal access to scripture or track how regularly members engage with the Bible.

The absence of a structured, accessible, and automated system for delivering daily Bible verses highlights the need for a digital solution. Bible verse and prayer management system addresses this challenge by providing church members with daily scripture directly on their devices. The system ensures consistent spiritual engagement, supports the development of a disciplined habit of Bible reading, and allows the church, acting as the administrator, to guide and support the spiritual growth of its community effectively.

1.4 Objectives of project

1.4.1 General objective

The main objective of this study is to design, develop, and implement a Bible verse and prayer management system that allows church members to receive daily Bible verses and enhance their spiritual growth through consistent scripture reading

1.4.2 Specific Objectives

The specific objectives of this project are:

1. To design and develop a Bible verse and prayer management system that allows registered church members to securely log in and receive daily Bible verses and prayer notifications.
2. To provide administrative functionalities that enable the church administrator to manage users, schedule Bible verses and prayers, and control system access.
3. To evaluate the effectiveness of the system in promoting consistent Bible reading and prayer among church members through notification delivery and engagement monitoring.

1.5 Research Questions

The study seeks to answer the following questions:

1. How can a Bible verse and prayer management system be designed to allow church members to securely log in and receive daily Bible verse and prayer notifications?
2. How can the system enable the church administrator to manage users, Bible verses, prayers, and overall system operations effectively?
3. How effective is the Bible verse and prayer management system in encouraging regular Bible reading and prayer among church members?

1.6 Significance of the Study

The Bible verse and prayer management system is designed to benefit different stakeholders in the following ways:

1.6.1 Personal Interest

This project helps church members strengthen their daily spiritual practice by providing a simple, organized, and consistent way to receive Bible verses. It allows members to reflect and pray daily, building a habit of spiritual growth and devotion.

1.6.2 Academic Interest

From an academic perspective, this project demonstrates the practical application of information technology in religious practices. It provides an opportunity to apply theoretical knowledge of software development, database management, and user interface design to solve a real world problem.

1.6.3 Public Interest

For the church and the wider community, the system ensures that spiritual guidance is delivered efficiently and consistently. It reduces manual processes of distributing daily verses and allows the church to reach more members in a structured and organized way. By tracking engagement, the

system can help the church understand the needs of its members and improve communication and spiritual support.

1.7 Scope of the Project

1.7.1 Content Scope

The Bible verse and prayer management system provides secure login and logout functionalities for church members, allowing them to access daily Bible verses and prayer notifications. Church members are registered users who can only log in, read daily verses, and receive prayer notifications. The church administrator has full system privileges, including managing users, scheduling Bible verses and prayers, and monitoring engagement. Members do not have administrative rights. The system focuses strictly on Bible verse and prayer notification management and does not include other church services such as financial contributions or event management.

1.7.2 Geographical Scope

The system is fully implemented and operational in Gako church, serving church members across the district who have access to computers and reliable internet connectivity. The system is designed for use by members who can access the platform through internet enabled devices such as desktop computers, laptops, tablets, or smartphones. Church members within the district are able to receive daily Bible verse notifications and prayer messages online, while church administrators can monitor participation and engagement in real time through the system. This study uses Gako church as a case study because it represents a community where church members actively participate in religious activities but face challenges in maintaining consistent daily Bible reading. The district was selected due to accessibility, availability of church leadership cooperation, and relevance to the study objectives. The selected churches provided practical insights into how daily Bible verse notifications can improve spiritual engagement among members.

1.7.3 Time Scope

The system's operation and usage were completed and functional from **January 2026 to June 2026**, covering system design, module development, testing, deployment, and daily verse delivery.

1.8 Limitations of the Project

The Bible verse and prayer Management System has some limitations despite its benefits. It relies on an active internet connection, which may prevent members without reliable access from receiving daily Bible verses. Additionally, members must have a mobile phone, tablet, or computer to use the system, excluding those without such devices. The church also needs technical personnel to maintain and update the system regularly. Moreover, the system only provides daily Bible verses and prayer guidance, without supporting other church activities such as event notifications or donations. Finally, some members may require basic guidance to navigate the system, especially those less familiar with digital tools.

1.9 Organization of the Project

This project is organized into five chapters to provide a clear and structured presentation of the study.

Chapter One introduces the study, covering the general introduction, background of the study, problem statement, objectives, research questions, significance, scope, and limitations of the project.

Chapter Two presents the literature review, including definitions of key concepts, theoretical and empirical reviews, analysis of related systems, and the conceptual framework guiding the development of the system.

Chapter Three focuses on the research methodology, detailing the research design, population and sampling, data collection methods, data analysis, validity and reliability, as well as ethical considerations.

Chapter Four covers the system design and implementation, including system architecture, database design, interface design, coding, and testing of the Bible Verse & Prayer Management System.

Chapter Five presents the conclusions, recommendations, and areas for further research. This structure ensures a logical flow from understanding the problem to developing a practical solution that enables church members to receive daily Bible verses and prayer guidance efficiently.

CHAPTER 2: LITERATURE REVIEW

2.0 Introduction

This chapter reviews existing literature and systems related to delivering spiritual content digitally. It defines key concepts, explores theoretical and empirical foundations, and analyzes related systems to identify gaps that the Bible Verse and Prayer Management System aims to address. The chapter concludes with a conceptual framework showing how the system will operate to provide daily Bible verses and prayer guidance to church members.

2.1 Definition of Key Concepts

2.1.1 Bible Verse

A Bible verse is a specific passage or sentence from the Bible, chosen to provide spiritual insight, encouragement, or guidance. Daily reading of verses helps believers reflect, pray, and grow in their faith.

2.1.2 Prayer

Prayer is a spiritual practice through which individuals communicate with God. It may include praise, thanksgiving, confession, or requests for guidance and support. Daily prayer strengthens a believer's relationship with God and supports moral and spiritual growth.

2.1.3 Desktop Application

A desktop application is a software program designed to run on desktop or laptop computers. In this system, the desktop application is mainly used by church administrators to manage Bible verses and prayer schedules, register church members, and monitor participation and engagement. It provides a larger interface and more advanced management features, making it suitable for administrative tasks that require detailed data entry, reporting, and system control through computers connected to the internet.

2.1.4 System Administration

In this system, the church serves as the administrator, managing content, approving verses, scheduling daily notifications, and overseeing the proper use of the platform.

2.1.5 Notification System

A notification system delivers timely messages or alerts to users. For this project, it ensures church members receive daily verses and prayers directly on their devices.

2.2 Theoretical Review

The system is grounded in **Digital Spiritual Engagement Theory**, which suggests that technology can enhance spiritual practices by making religious content more accessible, interactive, and consistent. This theory emphasizes user engagement, ease of access, and timely delivery of content to support spiritual growth.

Additionally, **Behavioral Reinforcement Theory** supports the daily notification of verses and prayers, as consistent exposure to spiritual content encourages habit formation and deeper engagement in religious practices.

2.3 Empirical Review

Various mobile and online systems already exist for delivering religious content, such as Bible apps, devotion apps, and Christian meditation platforms. Studies show that users of such systems experience improved spiritual discipline, higher engagement in daily devotion, and increased satisfaction with their religious practice. However, these systems often lack customization for local church administration, daily scheduling specific to a congregation, or the integration of both Bible verses and prayers in a unified, automated platform.

2.4 Review of Related Systems

2.4.1 YouVersion Bible App

YouVersion is a widely used Bible application that provides full access to the Bible, reading plans, and daily verses. Users can receive notifications for daily verses. However, it is designed for a

global audience and does not allow a specific church to control which verses are sent or schedule them according to their congregation. It lacks customization for individual church needs.

2.4.2 Daily Devotional Apps

These apps provide daily devotional content, including Bible verses, reflections, and prayer guides. Users can get reminders to read the daily content. The limitation is that these apps often combine verses with other content like stories or teachings, which may distract users who only want a daily Bible verse notification. They also do not give church administrators control over what verse is sent and when.

2.4.3 Church Notification Systems

Some church management systems include features for sending announcements, event reminders, or messages to members. While these systems can deliver notifications, they are not designed specifically to send daily Bible verses. They lack a dedicated platform for spiritual engagement through Bible verses alone.

2.4.4 Summary of the Gap

Existing systems either provide daily Bible verses globally or send general notifications, but none are specifically designed to meet the needs of a local church. They often lack the ability for a church to fully control which verses are sent and when, and may include additional content that can distract members from the daily reading. Most systems also combine multiple features like devotionals, teachings, or announcements, which can reduce the focus on daily Bible engagement. The Bible Verse and Prayer Management System addresses this gap by offering a simple, focused platform where the church can schedule and send only the daily Bible verse to its members, promoting consistent spiritual engagement and ensuring that the notifications are directly relevant to the local congregation.

2.5 Conceptual Framework

The conceptual framework of the Bible Verse and Prayer Management System illustrates the interaction between the system components, users, and outputs. The system involves two main actors: the church administrator and church members.

The church administrator logs into the system to register members, manage user accounts, prepare Bible verses and prayers, and schedule daily notifications. The administrator controls system operations and content distribution.

Church members log into the system using secure credentials to access daily Bible verses and prayer notifications. Members can view the content sent by the administrator but cannot modify or manage system data.

The system processes scheduled verses and prayers and automatically sends notifications to members. The output includes daily Bible verse notifications, prayer reminders, and engagement records that allow the administrator to monitor participation.

This framework ensures controlled access, effective content delivery, and consistent spiritual engagement among church members.

Figure 1: Conceptual Framework of the Bible Verse Notification System

CHAPTER 3: RESEARCH METHODOLOGY

3.0 Introduction

This chapter presents the methodology used to design and implement the Bible Verse Notification System. It explains the system design, architecture, components, data flow, and technologies used. The system is aimed at helping church members receive daily Bible verse notifications sent by the church.

3.1 Research Design

The study adopts a descriptive and developmental research design. It involves designing, developing, and testing a notification system. The descriptive aspect allows understanding of existing notification systems, while the developmental aspect focuses on creating a functional system that meets the church members' needs.

3.2 Population and Sample

The population of this study consists of church members and church administrators within Nyamagabe District who are involved in daily Bible reading and prayer activities. This population was selected because they are the primary users and beneficiaries of the Bible Verse and Prayer Management System.

A sample was selected from the population to represent the overall group. Church administrators were included because they are responsible for managing Bible verses, prayers, and system operations. Church members were selected to evaluate how the system supports daily spiritual engagement.

The sampling approach was chosen to ensure that participants had direct experience with church communication and devotional practices. This helped the researcher collect relevant and reliable data required for designing and evaluating the system effectively.

3.3 System Development Approach

The development of the Bible Verse Notification System will follow the Waterfall Model, which is a sequential approach to software development. The process begins with requirement analysis,

where the needs of the church and its members are identified, particularly regarding the delivery of daily Bible verse notifications. Once the requirements are clearly defined, the system design phase begins, during which diagrams, models, and frameworks are created to represent how the system will function. Following the design, the implementation phase takes place, where the system is developed using suitable programming languages, tools, and technologies. After development, the system undergoes rigorous testing to identify and correct errors, ensuring it operates as intended. Finally, the system is deployed, making it accessible to the church and its members, with provisions for maintenance and support to address any future issues or updates. This structured approach ensures that the system is developed efficiently and meets the intended objectives of providing timely and accurate Bible verse notifications to church members.

3.3 Data Collection Techniques and Methods

Data collection is the process of gathering and measuring information on targeted variables in an established systematic manner, which enables the researcher to answer relevant questions and evaluate outcomes. In system development studies, common approaches include inquisitive techniques such as interviews, questionnaires, brainstorming, and focus groups, as well as observational techniques such as participant observation. These methods help in understanding user needs, system requirements, and operational challenges. In this study, different data collection methods are identified; however, the interview technique is primarily used to collect data for the development of the Bible Verse Notification System.

3.3.1 Interview

Interview is a very powerful method for gathering data because it allows the interviewer to clarify issues and obtain detailed information from respondents. This method provides an opportunity to gain an in-depth understanding of users' needs and system requirements. In this study, interviews are conducted with church administrators to gather information about how Bible verses are selected, how notifications are sent, and the challenges faced in the current communication process. A one on one interview technique is used to collect data, which helps the researcher obtain clear, accurate, and reliable information required for designing an effective Bible Verse Notification System

3.3.2 Observation

Observation is the process of closely monitoring people or activities in order to obtain information. It helps in collecting real-life data from naturally occurring situations. Through observation, hidden or unnoticed challenges in the current system are revealed. This technique allows the collection of first hand information rather than second hand information by directly examining how church members currently receive communication from the church. Observation helps the researcher understand practical issues related to message delivery, timing, and accessibility, which are important for improving the proposed notification system.

3.4 Collection of Data

In this project, data collection involves systematically gathering information to address the objectives of developing the Bible Verse Notification System. Various methods such as interviews, observation, and document review are used to obtain relevant data. The choice of these methods depends on the nature of the study and the type of information required. Ensuring the reliability and validity of the collected data is essential for maintaining the integrity of the system design. Ethical considerations, such as informed consent and responsible data usage, are also observed during the data collection process. Church administrators are interviewed to provide answers to the research questions. Using the techniques described in the previous section, data collection is carried out through structured interviews, where respondents are required to provide complete and accurate information related to the system requirements.

3.5 Presentation of Data and Analysis of Data

The collected data is considered raw data and must be processed before it can be used effectively in system development. Data analysis plays an important role in interpreting the collected information and helps in making informed decisions or answering research questions. This section presents the analysis of the evidence gathered and its interpretation in relation to the objectives of the study. The main focus of this analysis is to evaluate the requirements, functionality, and effectiveness of the **Bible Verse Notification System**. The analyzed data helps in understanding user needs, system performance expectations, and how the proposed system improves communication between the church and its members through daily Bible verse notifications.

3.6 Validity and Reliability

Validity and reliability are closely related concepts, although they have different meanings. A measurement can be reliable without being valid; however, if a measurement is valid, it is usually also reliable. Ensuring both validity and reliability is essential for maintaining the credibility and accuracy of the research findings and the system design (Maslakci, 2020).

3.6.1 Reliability

Reliability refers to the degree to which a data collection method consistently measures what it is intended to measure. If the same results can be obtained repeatedly by using the same methods under similar conditions, the measurement is considered reliable. In this study, reliability is ensured by using consistent data collection techniques, particularly structured interviews with church administrators, to gather accurate and dependable information for the development of the Bible Verse Notification System.

3.6.2 Validity

Validity refers to how accurately a method measures what it is intended to measure. Research with high validity produces results that reflect real conditions, characteristics, and needs of the users. In this study, validity is ensured by designing interview questions that directly relate to the objectives of the Bible Verse Notification System. High reliability contributes to validity; however, validity is more critical because the research must measure what it claims to measure. By focusing on relevant system requirements and real user needs, the collected data remains both valid and useful for system development (Maslakci, 2020).

3.7 Ethical Considerations

Ethical considerations play a vital role in research involving human participants. In this study, several ethical issues are addressed to ensure the rights, well-being, and confidentiality of participants. Informed consent is obtained from all participants before their involvement in the research. The purpose, procedures, potential risks, and benefits of the study are clearly explained, allowing participants to make informed decisions. Participation is entirely voluntary, and participants are informed of their right to withdraw from the study at any time without any negative

consequences. Confidentiality of the collected information is maintained, and the data is used strictly for academic and system development purposes
